

Truss Jib

Truss Jibs - A truss jib is used to pick up and position trusses. It is an extended jib attachment that is equipped together with a pyramid or triangular shaped frame. Usually, truss jibs are mounted on machines like for example a skid steer loader, a compact telehandler or even a forklift using a quick-coupler attachment.

Older kind cranes that have deep triangular truss jibs are most often assemble and fastened using bolts and rivets into standard open structural shapes. There are rarely any welds on these kind jibs. Each and every riveted or bolted joint is susceptible to rusting and therefore needs regular upkeep and check up.

Truss jibs are made with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This design can cause narrow separation amid the flat surfaces of the lacings. There is little room and limited access to clean and preserve them against rust. A lot of bolts loosen and corrode within their bores and should be changed.
